A clear process for reporting adherence to digital solutions in publications did not exist, limiting the value of published data.

We wanted to connect back to EVIDENCE to showcase that a similar model might also be applied to reporting digital studies of adherence.

We reviewed the EVIDENCE checklist to understand what the authors had recommended in terms of reporting adherence to BioMeTs and ensure that our recommendations were consistent with EVIDENCE.

Alternatively, if we noted substantial deviations between EVIDENCE and our recommendations, we could provide a rationale.

We adopted this same model as we developed recommendations for reporting adherence, which strengthened our resulting manuscript.

The EVIDENCE checklist provides a clear process for authors to follow throughout study design, data collection, analysis, and reporting.

— Jessie Bakker, MS PhD, Executive Vice President of Medical Affairs, Signifier Medical Technologies Ltd

✓ The checklist provided a model for developing recommendations for reporting adherence.
✓ We were able to ensure our guidance was consistent across other related research efforts.
